

SAPPHIRE Demo Script – Invoice Intake & Upload Workflows

This document translates the discussion and decisions captured in the meeting recording "[Urgent] Sapphire Figma Demo alignment checkpoint1-20260421_103859" into a clear, screen-by-screen demo script suitable for building a clickable Figma prototype.

IMPORTANT BOUNDARIES:

- All flows, UI decisions, content types (list, card, table, carousel), and interactions listed below are explicitly discussed in the transcript.
- No new capabilities, UI patterns, or actions have been invented beyond what is stated or agreed verbally.
- System behavior reflects current or target 2606 deliverability as discussed.

Workflow 1: Invoice Intake – Start of Day Exception Handling

Entry Point & Context

- Persona: Accounts Payable (AP) user
- Starting point: Beginning of the workday
- System context: Overnight processing has completed
- Trigger: Intake system signals that new invoices arrived overnight

Screen 1: Proactive Intake Notification

What is shown on screen:

- SAP screen with Joule (assistant) visible (expanded, not minimized)
- Message from Joule indicating overnight activity

Conversation / Message Content:

- Joule indicates: there are multiple (example discussed: 3) new invoices that arrived overnight in the inbox
- Joule asks whether the user wants to review them

Interaction Pattern:

- This is a system-initiated message (not user-prompted)
- Message may include an action link or button to continue reviewing

Screen 2: Intake Summary – What Needs Attention

What is shown on screen:

- Joule presents a summary of invoices that need attention
- Items discussed in the transcript include:
 - Blocked invoice (e.g., duplicate)
 - Invoice with validation error (e.g., tax code)
 - Invoice missing goods receipt

Data Representation Decisions (from transcript):

- Multiple invoices are shown as a LIST or CAROUSEL depending on count
- Each invoice includes its SIEM ID
- SIEM ID must be a deep link to the actual invoice detail screen

Interaction Pattern:

- Joule highlights recommended next steps
- Actions are provided as buttons inside the message/card (not quick replies below the chat box)

Screen 3: Validation Error Resolution (Tax Code Example)

Trigger:

- User selects the validation-related invoice or chooses the suggested validation action

What Joule Is 'Thinking / Considering' (implied mechanics discussed):

- Joule fetches validation results from invoice validation
- Identifies which tax code or validation rule failed

What is shown on screen:

- Invoice detail appears in a SIDE PANEL or CARD
- Joule explains the validation issue in text
- Proposed fix is shown

Conversation Content:

- Joule explains what is wrong and what change will fix it
- Joule asks for confirmation before applying changes

Interaction Pattern (as discussed):

- User confirms whether to apply the fix
- Joule confirms fix and states that validation is re-checked and cleared

Screen 4: Duplicate Invoice Review

Trigger:

- User selects the blocked / duplicate invoice

What is shown on screen:

- Joule presents a comparison of two potentially duplicate invoices
- Format discussed: side-by-side cards OR carousel
- A TABLE may be used to compare key fields (date, amount, etc.)
- Each invoice remains deep-linkable via SIEM ID

Conversation Content:

- Joule explains why the invoice is flagged as duplicate
- Joule asks which invoice should be treated as valid

Interaction Pattern:

- User chooses whether it is truly a duplicate or not
- If resolved, Joule confirms the invoice is no longer blocked

Screen 5: Missing Goods Receipt Exception

Trigger:

- User selects invoice with missing goods receipt

What Joule Is 'Thinking / Considering':

- Joule detects GR status mismatch between PO and invoice

What is shown on screen:

- Joule explains that goods receipt is missing
- Related PO information can be referenced

Actions Discussed:

- Contact receiver
- (Future-looking) Create goods receipt on behalf of receiver

Demo-safe Outcome:

- Joule confirms next step (e.g., receiver contacted) and indicates it will re-check later

Workflow 2: Manual Invoice Upload & Payment Terms Exception

Entry Point & Context

- Persona remains AP user for simplicity
- Scenario: AP receives an invoice via email or outside normal channels

Screen 6: Upload Invoice

Trigger:

- User asks Joule to upload or create an invoice

What is shown on screen:

- Joule provides a 'Create invoice' / upload action
- Upload component appears (standalone or full page)

Important Copy Decision (explicitly discussed):

- After upload, system must say: 'Invoice submitted' or 'Invoice uploaded'
- NOT 'Invoice created', since creation is not guaranteed at this step

Screen 7: Payment Terms Check

Trigger:

- User asks to check payment terms or Joule suggests it as a next action

What Joule Is Doing:

- Fetches invoice payment terms
- Fetches corresponding PO payment terms
- Compares them

What is shown on screen:

- Summary stating how many invoices match vs mismatch
- Mismatched invoices can be selected for detail view

Screen 8: Payment Terms Comparison Detail

What is shown on screen:

- TABLE comparing invoice payment term vs PO payment term (codes such as MT02 vs MT14 were discussed)
- Linked references to invoice and PO

Conversation Content:

- Joule states that a mismatch is detected
- Joule asks which term should be accepted

Screen 9: Decision & Resolution

Actions Discussed:

- Reject invoice due to payment term mismatch
- Accept PO payment term

Demo Outcome (suggested in meeting):

- User rejects the invoice payment term
- Joule confirms rejection and logs the exception
